A safer steel industry: REDUCING RISKS

Moving Machinery
Before any machinery is cleaned, serviced or adjusted all sources of energy, including gravity, must be isolated, locked, or pinned to prevent movement.

Falling from Heights
Training is provided on how to use protective equipment and work safely at heights. Regular checks must be made to ensure procedures are followed.

Falling Objects
Measures must be taken to prevent objects from falling and all people removed from areas where this remains a possibility.

Gas and Asphyxiation
Workers are trained to ensure they can test for and eliminate dangerous gasses in confined spaces. Regular testing and auditing must occur.

Overhead Cranes
Daily checks must be carried out on cranes before use to maintain reliable operation.

Help keep the steel industry safe. Get involved in the steel safety day.
